Main article: Autodesk AutoCAD From 1984, Autodesk introduced AutoCAD's Windows-based version, which allowed multiple users to work on a single design at the same time. AutoCAD is available as shareware and as a subscription-based software suite. Overview AutoCAD lets you draw, edit and analyze designs using graphics, measurements and numbers. You can build mechanical, architectural, electrical and plumbing (MEP) designs. You can create technical drawings and commercial product packaging and labels. AutoCAD helps you to perform and manage 2D and 3D computer-aided design, manufacturing and construction (CAD/CAM) tasks. The integration of AutoCAD with other Autodesk applications also makes it easier to work with them. This article provides information about AutoCAD's main features. Using AutoCAD From the command line (CLI) or user interface (UI) you can use AutoCAD to create new drawings. AutoCAD exports drawings to Portable Network Graphics (PNG) and Autodesk DWG format files. You can import and export drawings from other CAD systems. Some drawing operations are faster using AutoCAD's Drawing Table feature. You can export to other CAD systems, exchange drawings with other people and control access to your data. Saving drawings, windows and viewports Using the utility Win+Save, you can save any drawing, window or viewport to the Clipboard. You can also save parts of the drawing to the Clipboard for later use. You can save your drawing as an editable template. Other utilities include Export.app, Export.etf and Export.pdf. Using AutoCAD's 3D environment You can view, edit and analyze designs using graphics, measurements and numbers. You can create mechanical, architectural, electrical and plumbing (MEP) designs. You can build technical drawings and commercial product packaging and labels. You can also create multibody structural diagrams (MBSDs) with the aid of AutoCAD's structural modules. Using AutoCAD's drawing features You can perform and manage 2D and 3D computer-aided design, manufacturing and construction (CAD/CAM) tasks. increasingly high. In consequence, the research and development of a new energy saving construction method becomes one of the important focuses in the industry. In the prior art, it is conventional to use a multi-head mirror to reflect the sunlight and use the heat energy, after converting the sunlight into heat energy, to use a heat pipe to transfer heat from heat sink to heat source, in this way, heat is dissipated from heat sink to heat source and the temperature difference is utilized to utilize the wind as a driving force to transfer heat energy, thereby generating electricity. However, there are some drawbacks of the prior art: (1) in the aforesaid method, the heat sink must be provided in a region where the wind is not, and the heat energy is transferred from heat sink to heat source through wind of the region where the heat sink is provided, so the wind force and heat energy transfer are limited; (2) the energy that is transferred by the wind is relatively small, and the service life of the heat pipe is relatively short, and the energy converting efficiency is relatively low; (3) when the heat sink is provided in a region where the wind is not, the wind force is not a1d647c40b
